

ABSTRACT OF THE DISCLOSURE

Provided are an image forming apparatus and an image forming method in which a decline in the recognition rate of voice recognition ascribable to operating sound during printing can be prevented by starting voice recognition after the printing operation has been suspended. The image forming apparatus is provided with a voice recognition unit (103) for recognizing entered voice, and a image printing unit (107) for printing prescribed print information. Whether the image printing unit (107) is currently printing is discriminated by an image-printing-state holding unit (106). Further, a request to start operation of a voice recognition unit (103) is accepted. If the request to start operation of the voice recognition unit (103) is accepted during printing of print information by the image printing unit (107), then printing of the print information by the image printing unit (107) is suspended. The state of a voice-recognition-state holding unit (102) is then changed and the voice recognition unit (103) starts performing recognition of input voice.
